Integration Flow – Summary of Work

Module Context

This integration is developed as part of the **Project Portfolio Management (PPM)** process in Oracle Fusion Applications. It enables the **automated import of project-related Per Diem costs**, approved through Business Trip and Conference workflows, and ensures those costs are correctly transferred from **Payroll to PPM** for processing.

---

1. Integration Development

An **App-Driven Orchestration Integration** was implemented using **Oracle Integration Cloud (OIC)**. The integration automates the flow of approved Per Diem expenses from the Payroll module to PPM module. It includes the following components:

- **BI Report Invocation**
  The integration calls a **BI Report** developed in Oracle Fusion to retrieve all **approved Per Diem transactions** related to **Business Trip and Conference requests**.
  The report is employee and project-specific, ensuring a detailed breakdown of expenses for each project under PPM.
- **FBDI File Generation**
  The fetched data is transformed into an **FBDI (File-Based Data Import)** file, adhering to the template structure of the **Import Costs** ESS job.
  This ensures compatibility with the Oracle Fusion PPM and Payroll import process.
- **ESS Job Execution – Import Costs**
  The integration invokes the **Import Costs ESS job** in Oracle Fusion, which imports the Per Diem costs into the relevant project records.
  These costs represent amounts borne by the company on behalf of employees, and they are attributed to the respective **projects and employees** in PPM.
- **Error Handling with Notifications**
  A comprehensive error-handling mechanism is built into the integration.
  In case of any processing failure (e.g., report fetch failure, transformation errors, or ESS job failure), an **email notification** is sent automatically to alert the responsible team or individual.

---

2. Integration Endpoint

- The **REST endpoint URL** of the integration was generated and securely saved.
  This endpoint is triggered by the custom ESS job, ensuring seamless execution without manual input.

---

3. ESS Job Triggering

- A **Custom ESS Job** was configured within Oracle Fusion to serve as the trigger mechanism for the integration.
  - The ESS job can be scheduled or invoked manually as needed.
  - It eliminates the need for human intervention and enables **scheduled automation** of the Import Cost process.

Custom ESS Job Configuration

1. BI Report Setup

- A **BI Publisher Data Model** of type **HTTP XML Feed** was created.
  This data model connects directly to the integration's HTTP endpoint.
- A **BI Report** was built on top of this data model.
  This report acts as a bridge between the ESS job and the integration, allowing report-based triggering of the integration flow.

2. ESS Job Creation

- A **Custom ESS Job** was created in Oracle Fusion Applications using the path of the BI report.
  - The job is configured to call the integration automatically.
  - It facilitates the **scheduled or manual import of Per Diem costs** into Oracle Fusion PPM.

End Result & Business Impact

- The solution ensures that **approved Per Diem costs associated with projects** are automatically transferred from Payroll to PPM.
- It reduces manual effort, eliminates errors, and enhances traceability of project-related expenses by **accurately attributing costs per employee and per project**.

- It ensures the organization meets its financial reporting and payroll processing requirements in a timely and automated manner

Functional Configuration:

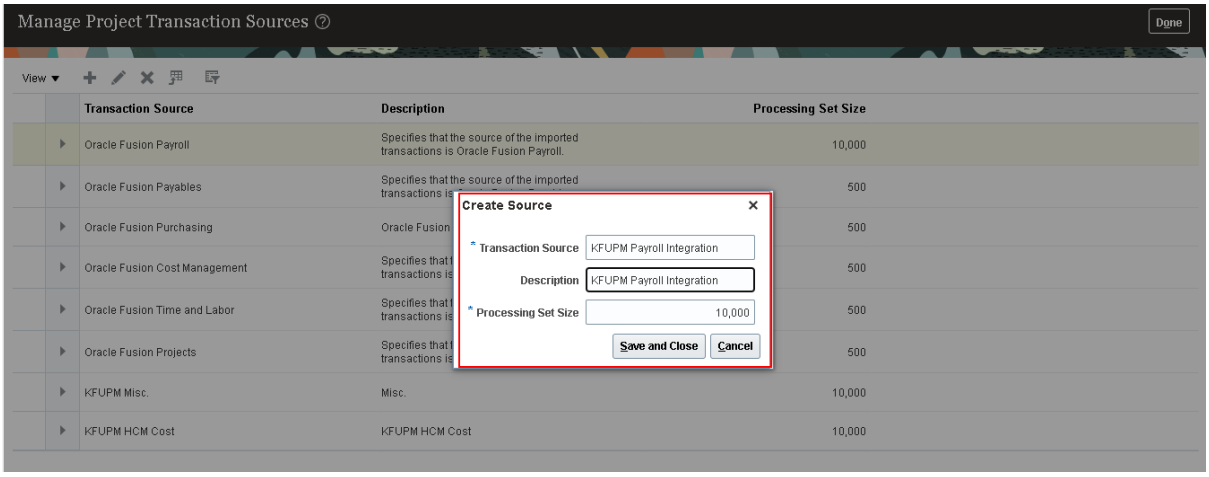
We need to configure the below

1. Project Transaction Source
2. Transaction Document
3. Transaction Document Entry

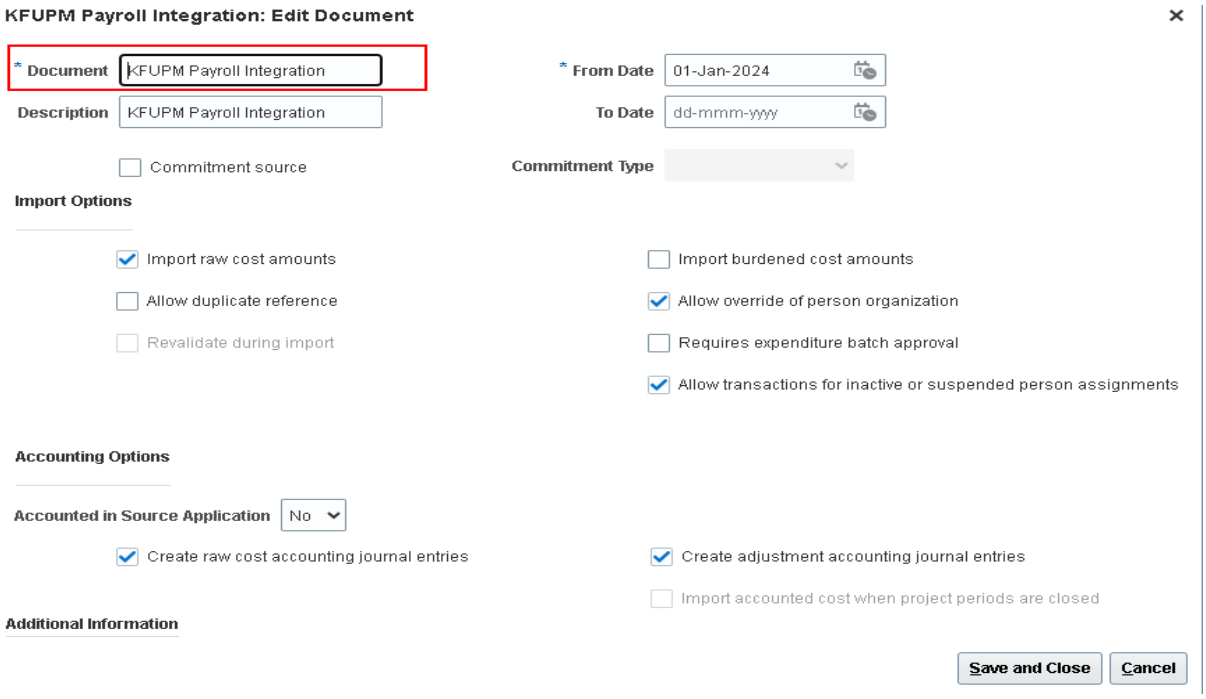
NAME: "KFUPM Payroll Integration" (Same Name for **Source**, **Document**, and **Document Entry**)

Navigation >> Setup and Maintenance >>Task >>Manage Project Transaction Sources

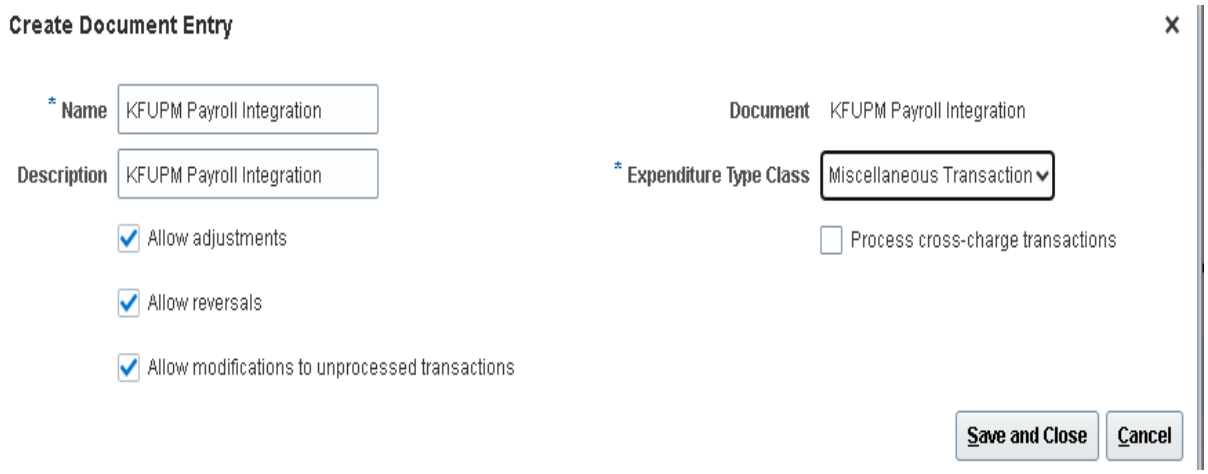
<u>Project Transaction</u> <u>Source</u>



Transaction Document



Transaction Document Entry



You can view the created Transaction Source, Document, and Document Entry in the image below

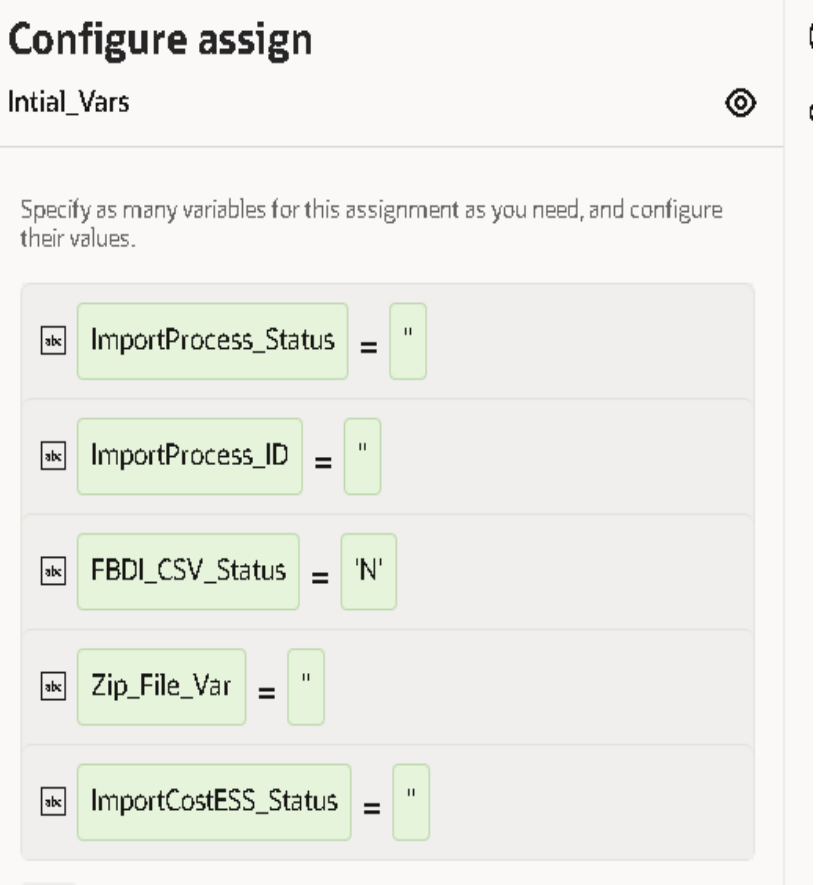
Technical Configuration:

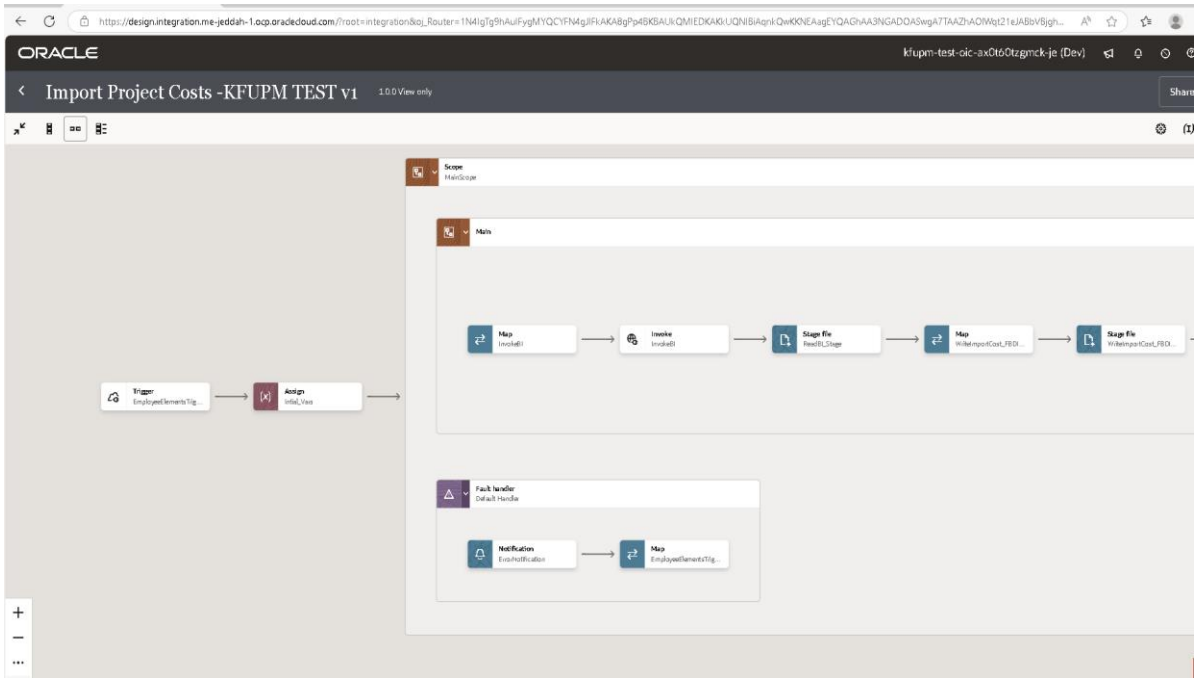
Integration Development

- Integration Name: *Import Project Costs - KFUPM TEST v1*
- Integration Type: *App-Driven*
- Connections Used:
  - REST Connection:
    - Purpose: Used as a trigger to invoke the integration
    - Connection Name: *KFUPM_TEST_REDT_TRIG*
  - SOAP Connection:
    - Purpose: Used to fetch approved Per Diem transactions by running the BI report from the Fusion Application
    - Connection Name: *TEST_KFUPM_BI_SOAP*
  - ERP Connection:
    - Purpose: Used to load the FBDI ZIP file to UCM and submit the Import Cost ESS job
    - Connection Name: *TEST_KFUPM_ERP*

Variables Used in the Integration.



The image below illustrates the creation of variables and the scope defined for error handling. It also shows the invocation of the BI report, followed by stage file operations to read the BI report data and write it in CSV format.

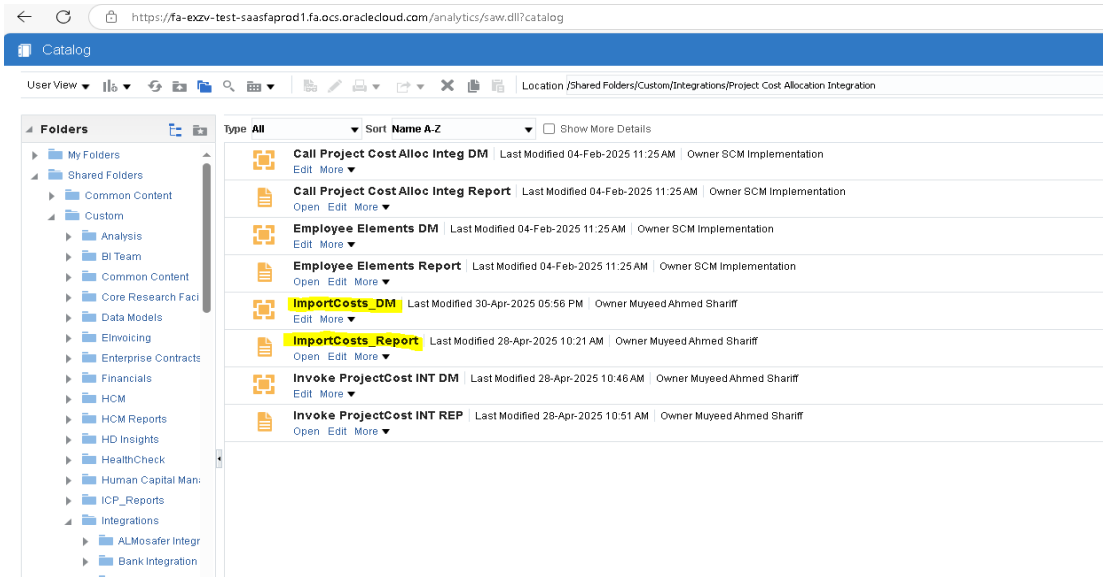


BIReportPath: /Custom/Integrations/Project Cost Allocation Integration/ImportCosts_Report.xdo

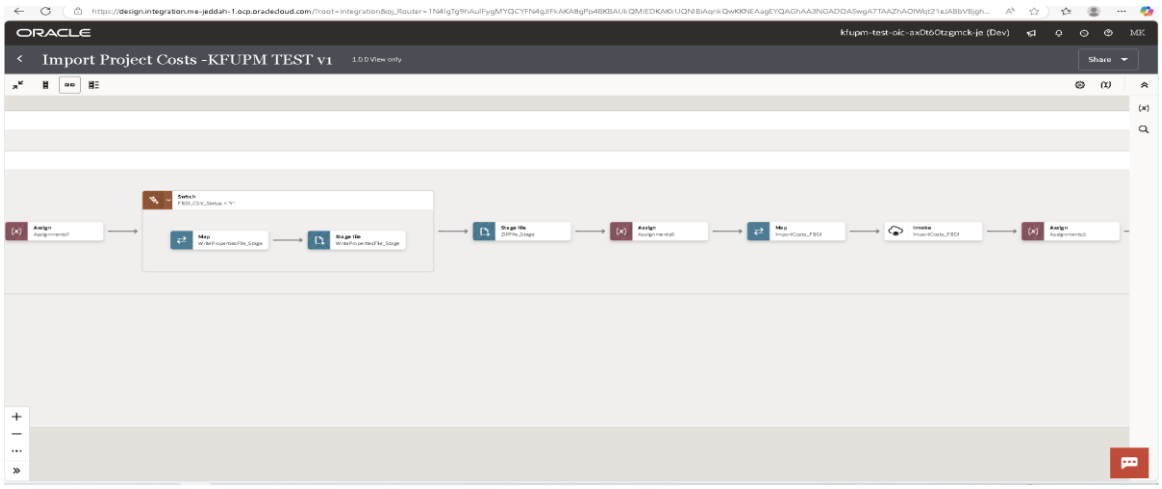
DataModelName: ImportCosts_DM

ReportName: ImportCosts_Report

ParameterName: p_approved_date.



The image below illustrates the creation of a properties file used for zipping the FBDI file. It checks the status of the previous BI response operation before proceeding to zip the files. Subsequently, the **"Import Bulk Data into Oracle ERP Cloud"** operation is used to load the zipped file into UCM, and the ESS job process ID is assigned to a variable.



The image below illustrates the use of a while loop to monitor the ESS job process status, ensuring its completion before proceeding to submit the **Import Cost ESS Job**. After submission, another while loop is used to check the status of the Import Cost ESS Job.

Parameters Used During ESS Job Submission.

JOB PACKAGE NAME: **oracle/apps/ess/projects/costing/transactions/onestop**

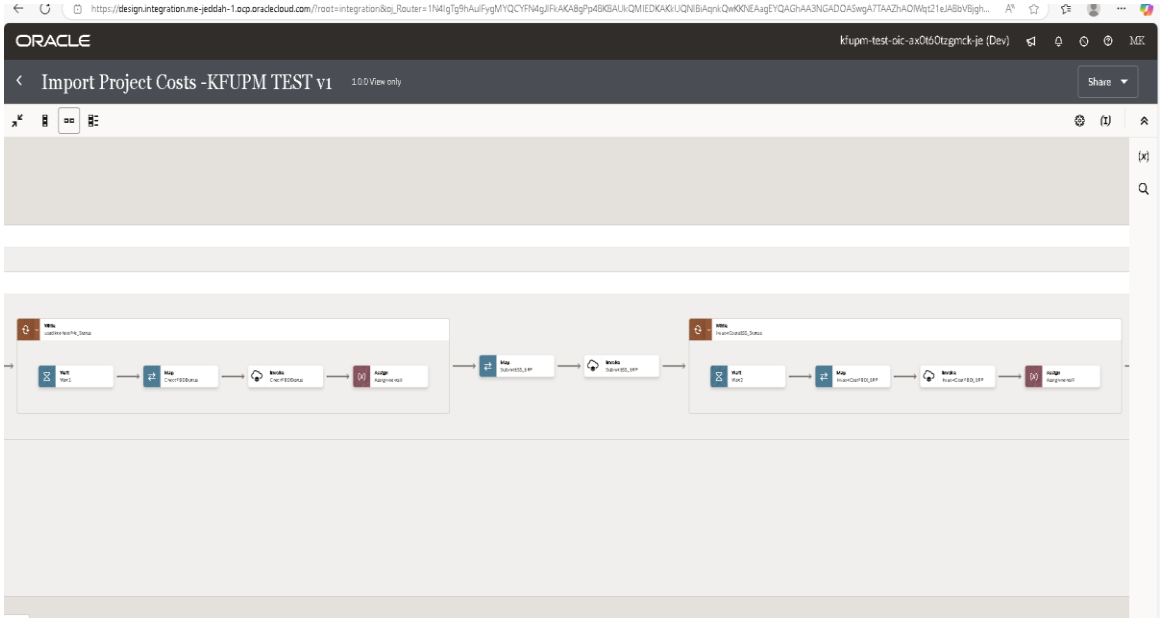
JOB DEFINITION NAME: **ImportProcessParallelEssJob**

PARAMETER 1: **KFUPM BU** PARAMETER2: **300000003347133**

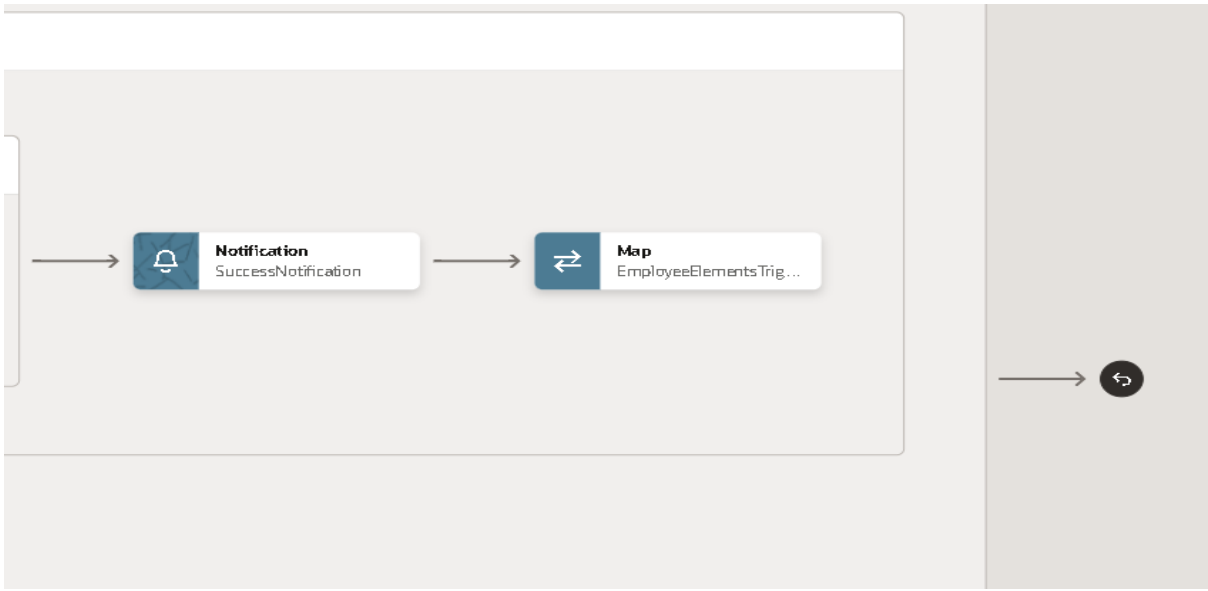
PARAMETER3: **IMPORT_AND_PROCESS** PARAMETER4: **PREV_NOT_IMPORTED**

PARAMETER6: **300000839058970** PARAMETER7: **300000839058971**

PARAMETER13: **ORA_PJC_DETAIL** PARAMETER: - **5, 8, 9, 10, 11, 12 = #NULL**



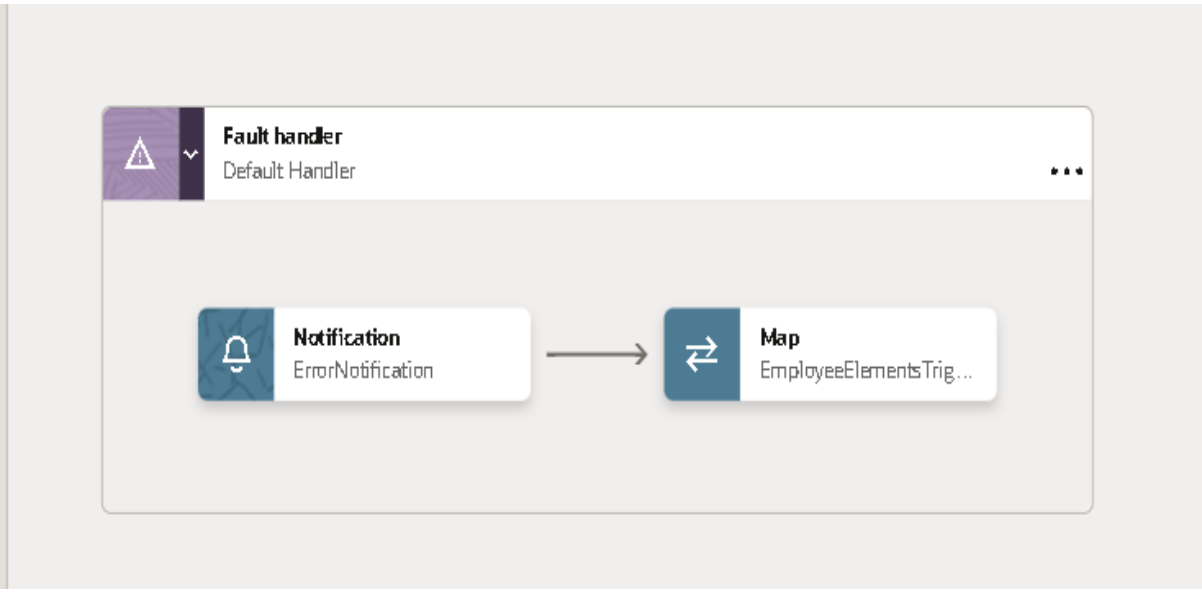
The image below illustrates that after the completion of the Import Cost ESS Job, a notification is triggered, and the integration flow is concluded at the endpoint with a success message in XML format.



FAULT HANDLER:

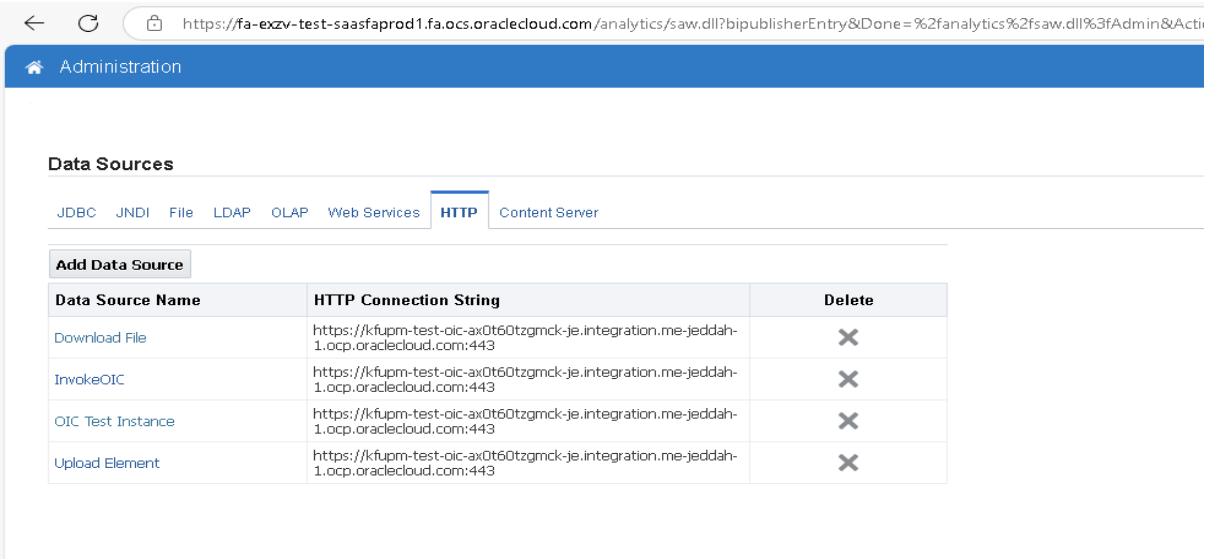
The image below illustrates the fault handler. If any error occurs in the above integration flow, an email notification is triggered, and the integration flow is concluded at the endpoint

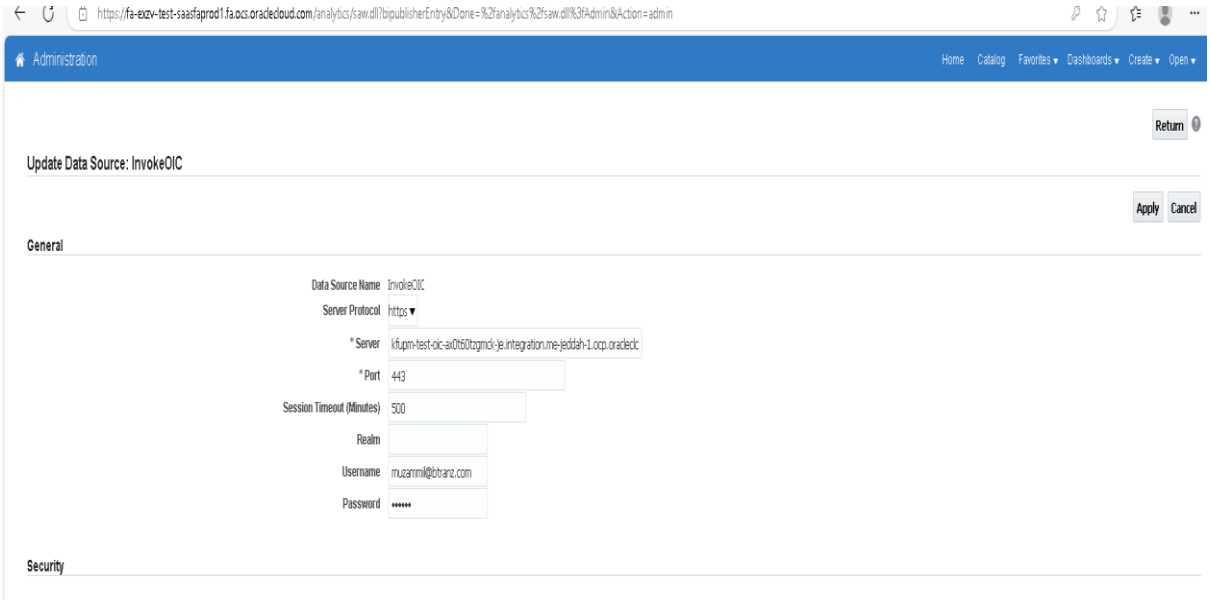
with a response marked as **ERROR**, including the error details in XML format.



Custom ESS Job Configuration

Create an HTTP Data Source in BI Administration of the OIC Instance > Manage Publishers>Data Sources>Add Data Source

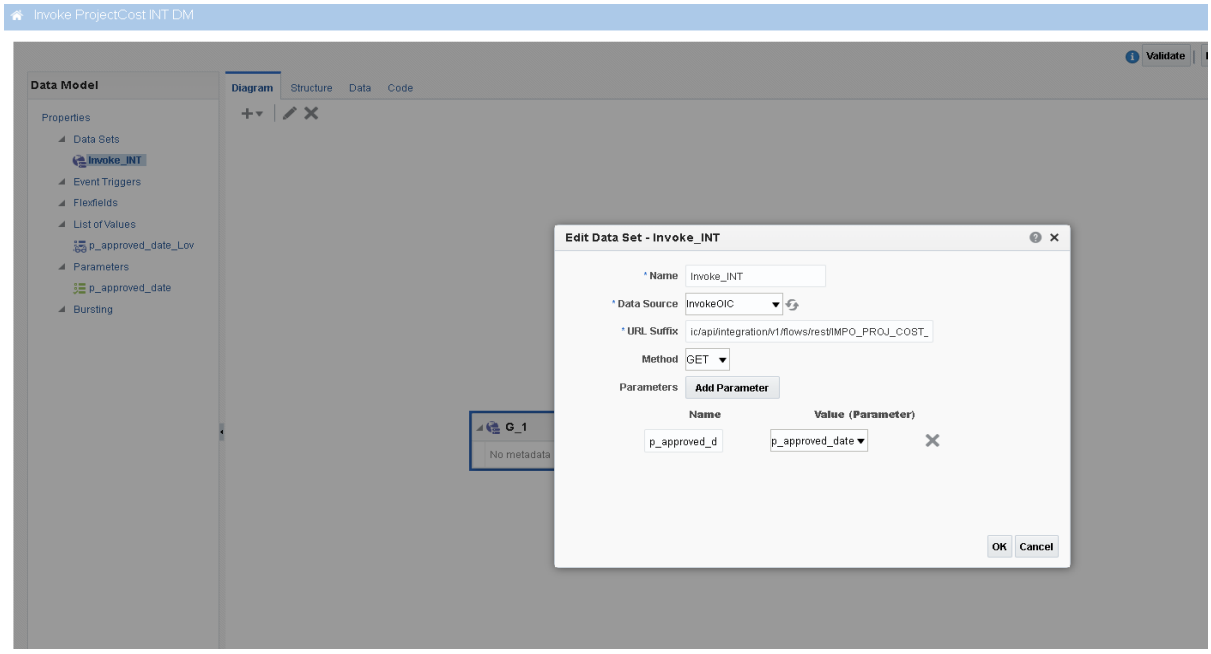




Server: **kfupm-test-oic-ax0t60tzgmck-je.integration.me-jeddah-1.ocp.oraclecloud.com**

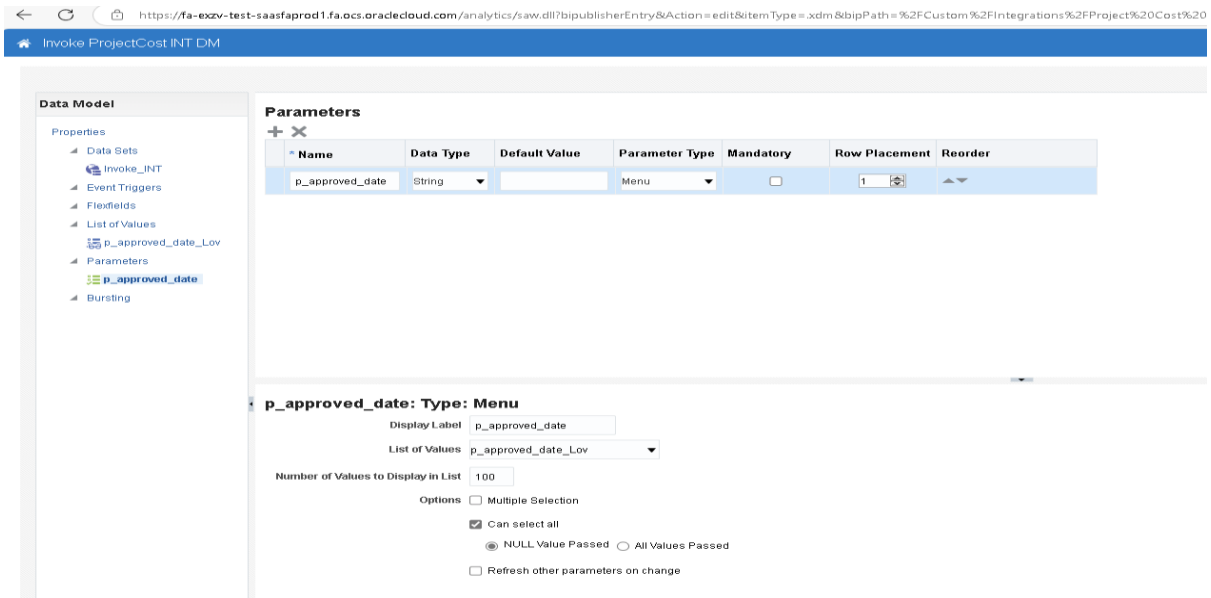
Create a Data Model for the HTTP (XML Feed) Dataset

Utilize the HTTP data source previously created in BI Administration to build a data model for the HTTP (XML Feed) dataset.



URL Suffix: It's The Integration End Point.

ic/api/integration/v1/flows/rest/IMPO_PROJ_COST__KFUP_TEST_V1/1.0/ImportProjectCosts

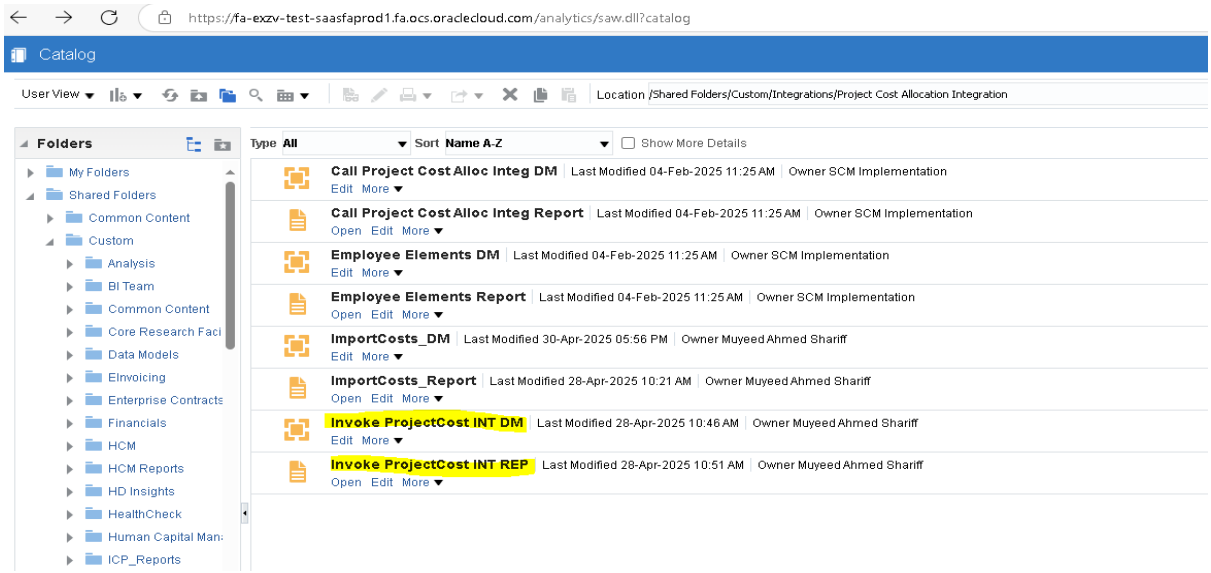


Note: Ensure that the parameter name (**p_approved_date**) is same across all related objects.

Report Parameter LOV Query:

```
WITH months AS (
  SELECT ADD_MONTHS(DATE '2020-01-01', LEVEL - 1) AS month_date
  FROM dual
  CONNECT BY ADD_MONTHS(DATE '2020-01-01', LEVEL - 1) <= TRUNC(SYSDATE,
'MM')
)
SELECT TO_CHAR(month_date, 'MON-YYYY', 'NLS_DATE_LANGUAGE=ENGLISH') AS
month_year
FROM months
ORDER BY month_date
```

Now, create the report using this data model, which can be used for creating the custom ESS job.



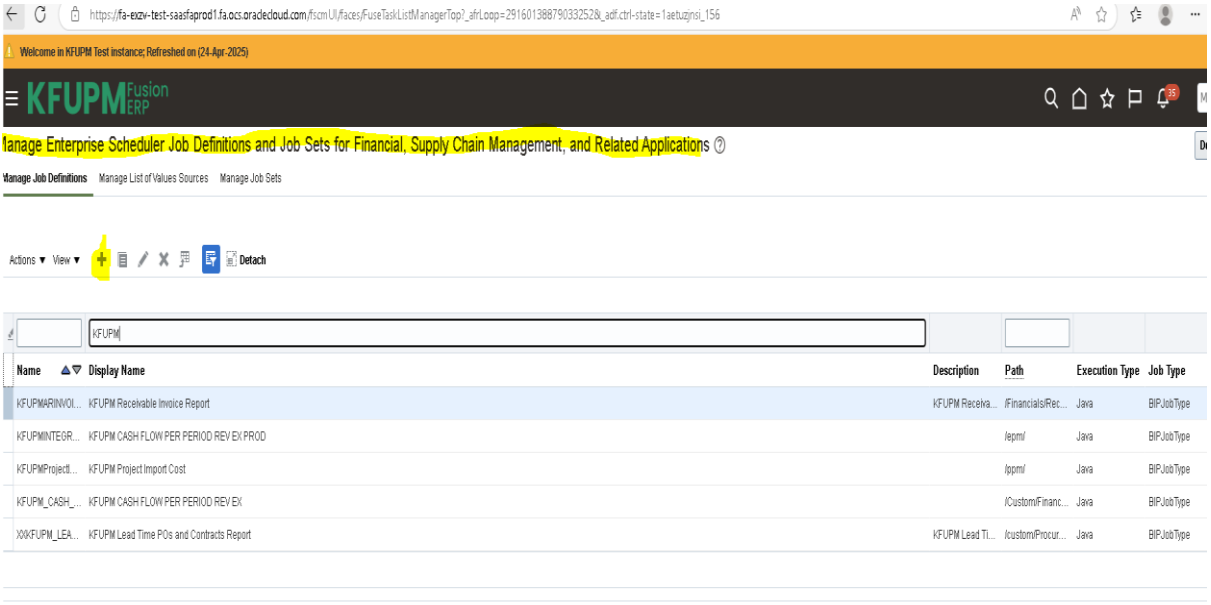
Report path /Custom/Integrations/Project Cost Allocation Integration/Invoke ProjectCost INT REP.xdo

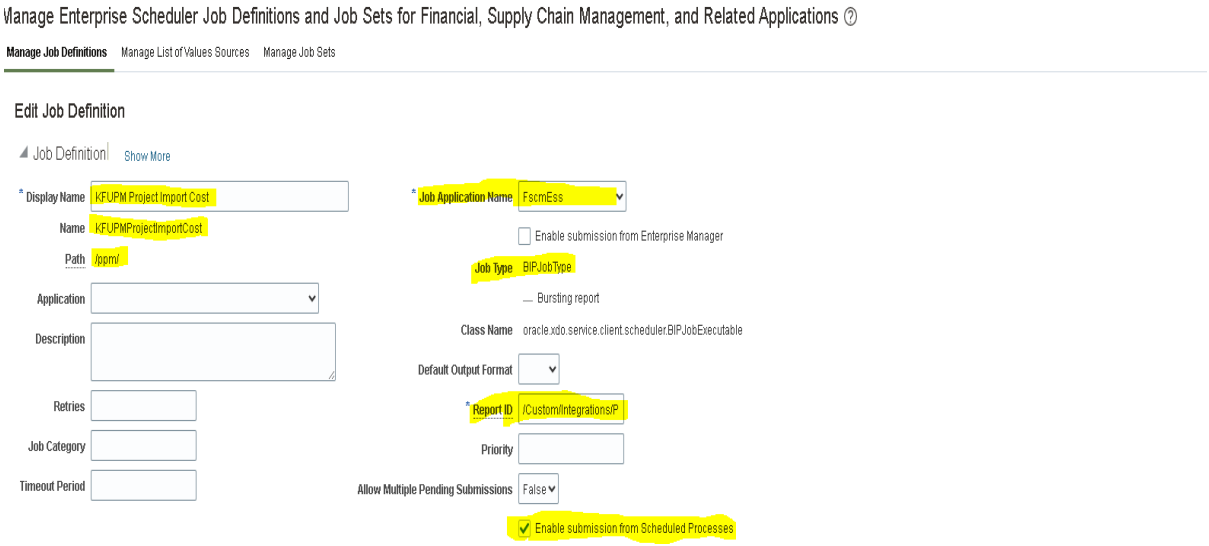
Note : This report triggers the created integration and can be executed using a custom ESS job.

Now, Navigate To Setup and maintenance > Tasks> Search for Task.

Task Name: Manage Enterprise Scheduler Job Definitions and Job Sets for Financial, Supply Chain Management, and Related Applications

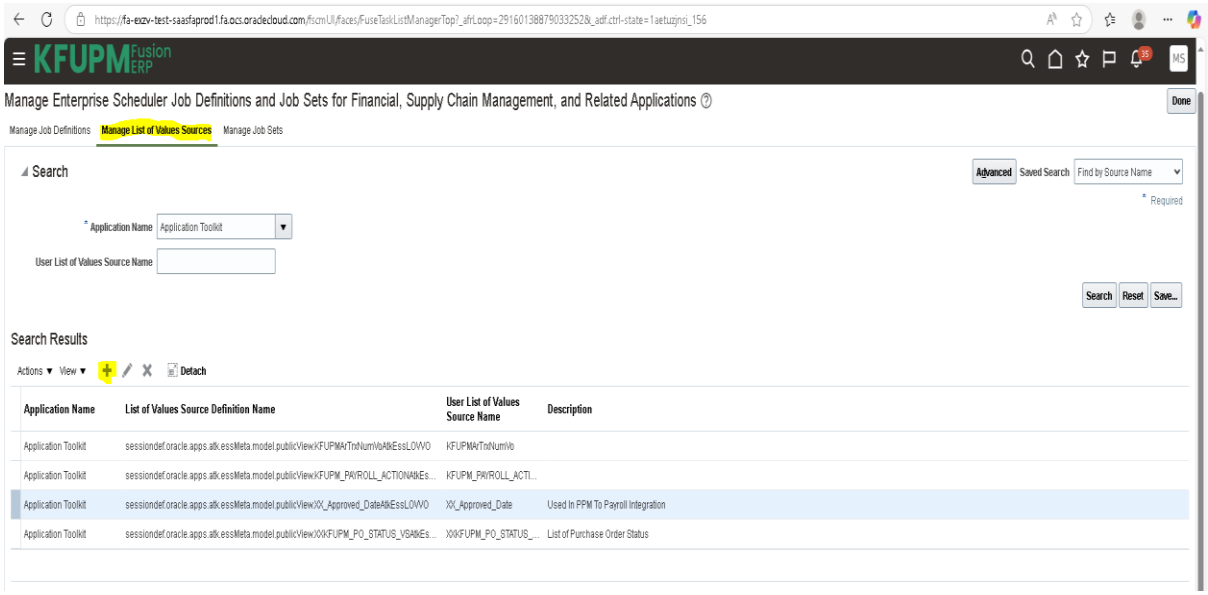
Click Add (+) Icon

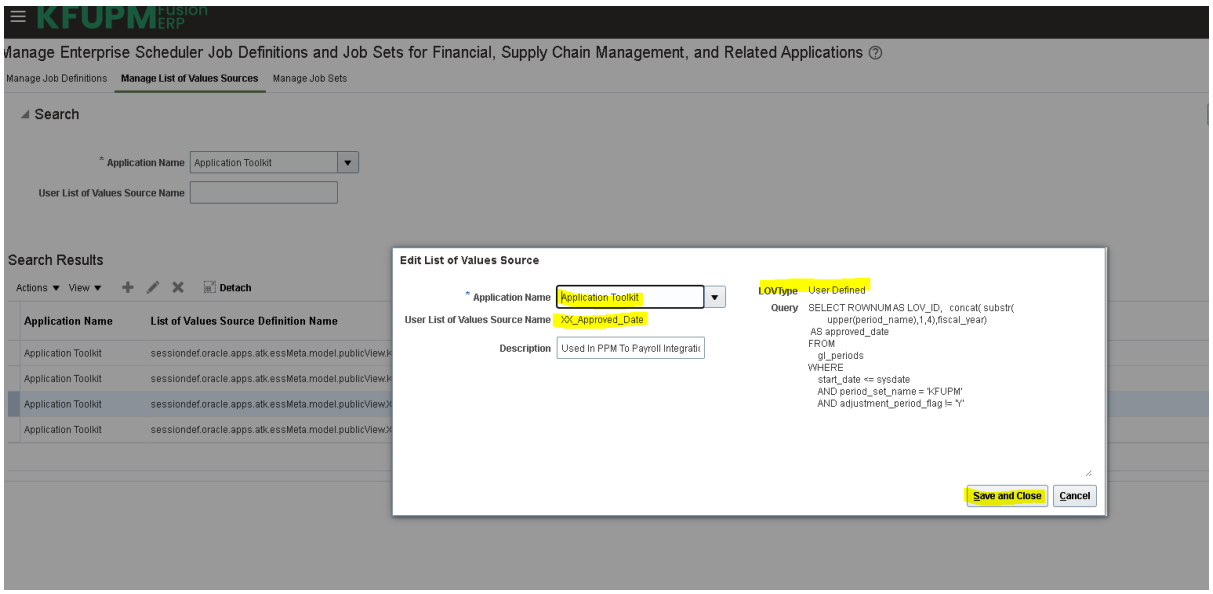




JobApplicationName: FscmEss
Job Type: BIPJobType
Path:/ppm/
Report ID : /Custom/Integrations/Project Cost Allocation Integration/Invoke ProjectCost INT REP.xdo

Create the **List of Values (LOV)** source to be used in parameter definitions for the custom ESS job.

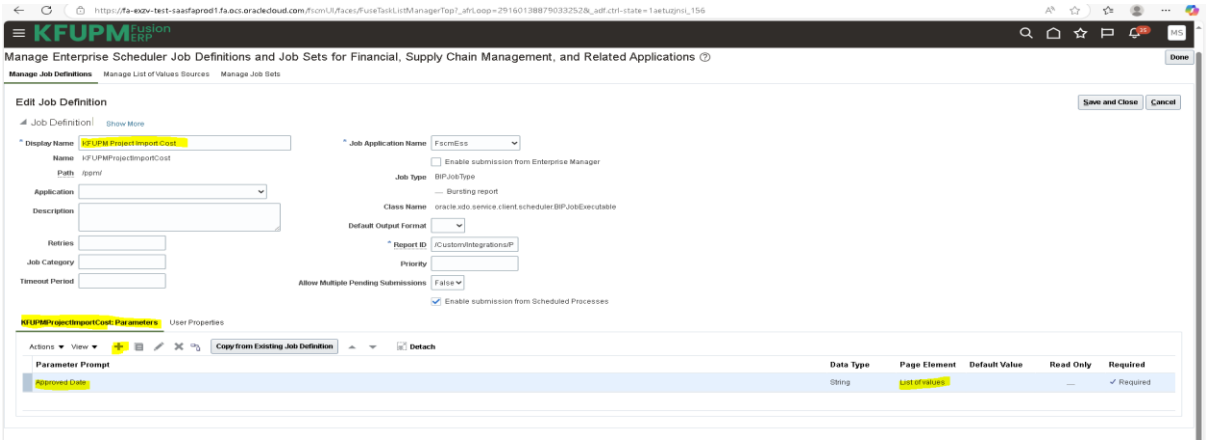


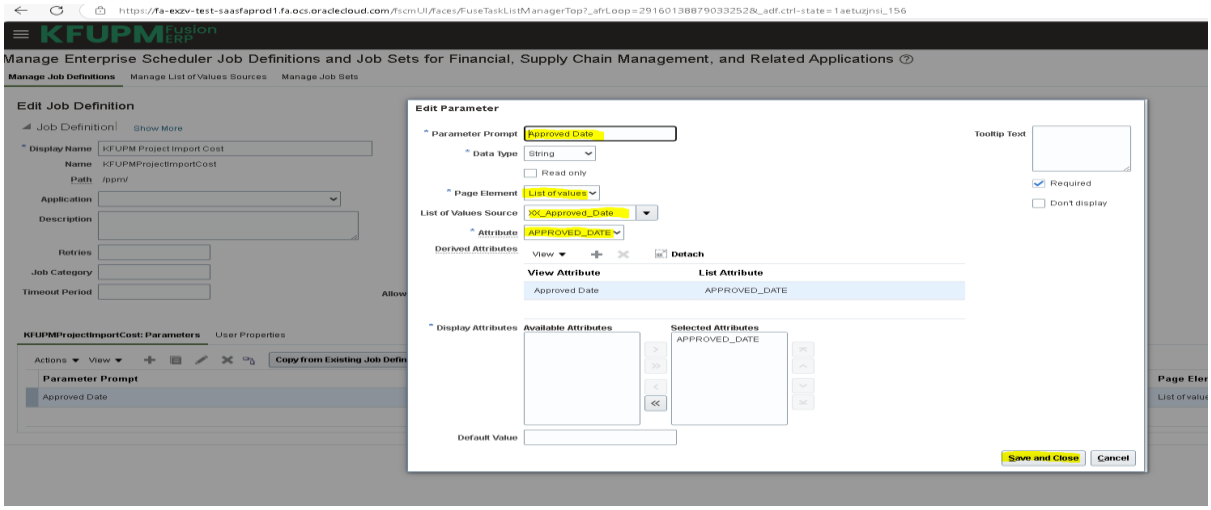


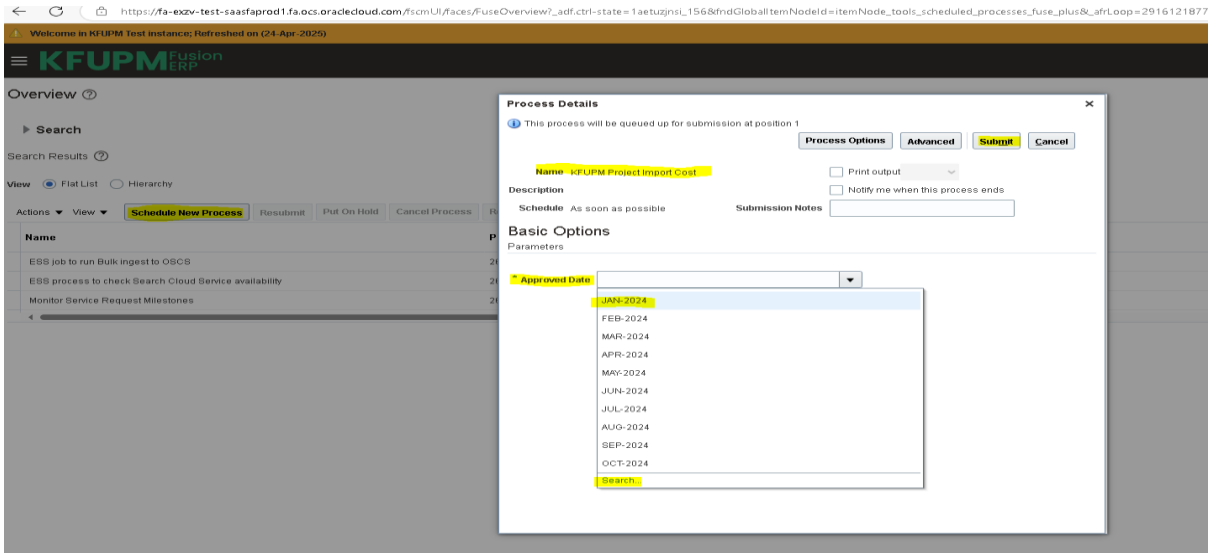
ESS LOV Query:

```
SELECT ROWNUM AS LOV_ID,   concat( substr(
       upper(period_name),1,4),fiscal_year)
 AS approved_date
FROM
   gl_periods
WHERE
   start_date <= sysdate
   AND period_set_name = 'KFUPM'
   AND adjustment_period_flag != 'Y'
```

Now, use this LOV source while configuring the ESS job parameter.







After successfully creating the custom ESS job, it will appear in the Scheduled Processes, and you will be able to pass the Approved Date parameter while submitting the ESS job, as shown below.
